**Year II Semester II**

**Economic Thinking in Agriculture (EAG 221-3/0)**

---

**Instructions**

Answer **only five (5)** questions selecting **three (3)** questions from **part one (I)** and **two (2)** questions from **part two (II)**

No. of questions : Seven (07)  
No. of pages : Four (04)  
Time : Three hours (3 hrs)  
Total marks allocated : 40/100

---

**Part I**

1.
  - a. What are the basic assumptions of a perfectly competitive market?
  - b. Graphically show the short run and long run equilibrium conditions of a perfectly competitive firm
  - c. A firm's average cost function (where **AC** is average cost in dollars and **q** is quantity) is  $AC = 200/q + 4 + 2q$ 
    - i. If the firm is perfectly competitive and if the price of its product is \$24, what is its optimal output rate?
    - ii. At this output rate, what are its profits?
    - iii. Derive the firm's short – run supply curve
2.
  - a. Discuss the meaning of the production function. What is the short-run and what is the long-run. How does the production function in the short-run differ from that in the long-run?
  - b. Following table shows the amount of rice production with the application of successive doses of Nitrogen fertilizer

<b>Nitrogen kg/ha</b>	<b>Rice yield kg/ha</b>
0	15
30	25
60	45
90	70
120	85
150	85
180	75

- i. Calculate Average Product and Marginal Product at each Nitrogen level
- ii. If the price of 1 kg of rice is 20 Rs. and price of 1 kg of Nitrogen fertilizer is 10 Rs. Calculate
  - A. MR
  - B. AR
  - C. TR
  - D. TC
  - E. Net Revenue

3.

- a. Briefly explain the demand shifters
- b. The demand function and supply function of potato in domestic market of Sri Lanka were estimated as

$$P = -2Q_D + 50$$

$$P = \frac{1}{2}Q_S + 25$$

where;  $Q$  = Quantity (Million tons),  $P$  = Price (Rs. Per kg)

- i. Sketch the demand and supply functions
- ii. Calculate equilibrium price and quantity in domestic potato market in Sri Lanka

- iii. Calculate price elasticity of demand at equilibrium price and comment on it
- iv. Calculate consumer surplus and producer surplus at equilibrium price
- v. If the government imposes a maximum price of Rs.5.00 per kg, calculate domestic supply, demand and surplus/ deficit
- vi. What are the measures that can be taken to solve the problem of deficit/ surplus?

4. Write short notes on the following;
- a. Market failure.
  - b. Public goods.
  - c. Externalities.
  - d. Coase Theorem.
  - e. Tragedy of commons

## Part II

5. Write short notes on the followings;
- a. Economic Model
  - b. Circular Flow of Rupees through Economy
  - c. Production Possibility Frontier
  - d. Inflation
6. .
- a. Define the following terms
    - i. GDP
    - ii. GNP
    - iii. NNP
    - iv. NI
  - b. Discuss rules in computing GDP

- c. Suppose we have an economy described by the following functions.

$$C = 50 + 0.8YD$$

$$\bar{I} = 70$$

$$\bar{G} = 200$$

$$\bar{TR} = 100$$

$$t = 0.20$$

- i. Calculate the equilibrium level of income and the multiplier in this model.
- ii. Calculate the budget surplus.
- iii. Suppose that  $t$  increases to 0.25. What is the new equilibrium income and the new multiplier?
- iv. Calculate the change in the budget surplus. Would you expect change in the surplus to be more or less if  $c = 0.9$  rather than 0.8?
- v. Can you explain why the multiplier is 1 when  $t = 1$

7.

- a. Discuss the following in relation to fisheries
  - i. Population Growth relationship
  - ii. Effort Catch relationship
  - iii. Open access equilibrium
- b. Distinguish between Maximum Sustainable Yield and Maximum Economic Yield of fisheries and show graphically how you find the Maximum Economic Yield.
