ABSTRACT

In the rapidly changing present industrial world saving time and travelling have become two major challenges for most industrialist, entrepreneurs and customers. In that concern today shopping has become more over through the internet; although this saves time it is doubtful whether it is really useful when you are on a journey. There are a lot of websites available today to purchase online, but not all websites are viewable through a mobile phone and even some phones do not have internet access, in terms of mobile phones finding solutions for the above mentioned problems is very critical. Having options to search and purchase products through your mobile will give a distinct advantage to travelers in terms of saving time, As mobiles are handheld devices including such applications is very effective.

Especially when people travel, finding the exact and the proper place to get their required items has been difficult with the time factor, with hundreds of thousands of shops lying beside the streets choosing the exact, money worth products is very important, In the meanwhile it should be in the convenient distance.

In contemporary there are no proper base to connect buyers and sellers. Creating such platforms is very essential. As a solution we are introducing the all new Inventory intermediate system for this problem. Inventory intermediate system will guide a person to save his time on searching products and will help most travelers to experience quality shopping.
